

NOAA FISHERIES SERVICE

NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

Your Query Parameters:

Query:	MRIP CATCH TIME SERIES
Year:	1981 - 2024
Summarize By:	ANNUAL
Fishing Year:	CALENDAR YEAR (JANUARY 1 - DECEMBER 31)
Species:	STRIPED MARLIN
Geographic Area:	HAWAII
Fishing Mode:	ALL MODES COMBINED
Fishing Area:	ALL AREAS COMBINED
Type of Catch:	HARVEST (TYPE A + B1)
Information:	NUMBERS OF FISH WEIGHT OF FISH (KILOGRAMS)

Notes on Query Results:

- MRIP does not support the use of estimates with a percent standard error above 50 and in those instances, recommends considering higher levels of aggregation (e.g., across states, geographic regions, or fishing modes).
- Due to COVID-related disruptions to the Access Point Angler Intercept Survey and subsequent gaps in catch records, some catch estimates are based in part on imputed data. Columns labeled 'Contribution of Imputed Data to (ESTIMATE)' represent the weighted percentage of catch rate information that can be attributed to imputed catch data. Note: This does *not* represent the percent difference between the estimate with and without imputed data incorporated. If no such column appears in your query results, no imputed data were used.
- Estimates for Hawaii (prior to 2023) and Puerto Rico (prior to 2014) are based on Marine Recreational Fisheries Statistics Survey methodology and have not been calibrated.
- Beginning in 2023, estimates for Hawaii are produced using certified MRIP survey designs and weighted estimation methods.

- As part of the government's guidelines for statistical programs, the Office of Management and Budget requires federal agencies to establish their own criteria for statistical precision (Standard 4.1.5 in OMB Standards and Guidelines for Statistical Surveys)
- Upper and lower confidence limits are calculated using a standard 95% confidence interval. The lower 95% confidence interval is truncated at 0 to match graph output.
- PSE, or percent standard error, is automatically included in all outputs. The higher an estimate's Percent Standard Error, or PSE, the larger the margin of error around the estimate, which means there is more uncertainty in the estimate.
- Estimates with a percent standard error exceeding 50 are not statistically different from zero using a standard 95% confidence interval. Note this significance comparison is not suggesting these estimates all equal zero, but is rather intended to illustrate their high uncertainty.

A PSE highlighted in yellow indicates an estimate with a PSE value 30 to 50 and should be treated with caution.

A PSE highlighted in red indicates a highly imprecise estimate with a PSE value greater than 50. MRIP does not support its use.

Data Sources by Geographic Area:

- MRIP: ME-LA (LA through 2013), HI, PR (through wave 4, 2017), WA/OR/CA (through 2004)
